

MyDeliveryEAR Module

Enterprise Application Archive (EAR) module packaging the full MyDelivery application for deployment to an application server (IBM WebSphere suggested by `ibm-application-bnd.xml`).

Purpose

- Aggregate WARs (Presentation, WebService) and JARs (ServiceApi, ServiceImpl, Properties, CrossDependencies) into a single deployable unit.
- Provide application-level deployment descriptors and vendor-specific bindings.

Key Files

- `META-INF/application.xml` : Declares modules (web, ejb/jar) included in EAR.
- `META-INF/ibm-application-bnd.xml` : IBM-specific bindings (classloading, security roles, shared libs).
- `META-INF/ibmconfig/cells/...` : Additional WebSphere configuration assets.

Build

- Maven module with packaging type `ear` (in parent POM) controlling inclusion artifacts & version alignment.

Extension

- Add new web module: update `application.xml` & parent POM `dependencyManagement`.
- Adjust classloading or security: modify IBM binding descriptors accordingly.

Deployment Scripts

- Coordinated with scripts in `Assembly/InstallScripts` at root or Properties module for environment provisioning.
