

Other / Root Modules

MyDeliveryParent

Parent Maven aggregator / dependencyManagement project controlling versions of shared dependencies (Spring, Apache HttpClient, Oval, JasperReports, Log4j, etc.) and plugin configurations (compiler, ear, war, jar packaging).

MyDeliveryCrossDependencies

Holds shared cross-cutting dependencies or integration stubs not fitting cleanly into API or Impl modules. Could define adapters, additional JPA entities, or third-party integration helpers.

Assembly (Root)

Deployment orchestration scripts:

- `deploy.py` , `dvnDeploy.py` , `start.py` : Automate build artifact distribution, environment setup, start sequences.
- `deployconfig.xml` : Configurable parameters (targets, hosts, credentials placeholders).

Root `pom.xml`

Defines multi-module build, common plugin configuration, corporate repositories, global properties (Java version, encoding).

`src/changes/changes.xml`

Change log tracking notable modifications for release notes (Maven Changes plugin).

Site Documentation (`src/site/site.xml`)

Maven Site generation descriptor (linking modules, reports, change logs, javadocs).

Creating Additional Docs

Add new Markdown files here or extend module-specific docs in this folder. Keep structure consistent for onboarding.
